

U.S. Environmental Protection Agency
2006 GTAP Advisory Board Report

GTAP-related activities ongoing within the US EPA include:

National Center for Environmental Economics, Office of Policy, Economics, and Innovation

- Using GTAP data, a global CGE model (solved in GAMS) has been developed to explore issues related to the coordination of trade and environmental policies. An attempt has been made to incorporate a more detailed representation of domestic taxes than have existed in the GTAP database. The model also incorporates a flexible labor supply and a government budget closure that requires that distortionary taxes be used to make up for reductions in government revenues following trade liberalization. Simulations have been preformed to determine how results from this model compare with “standard” models and findings in the “tax interaction” literature. The model has also been used to determine the potential for combining environmental taxes with trade liberalization.
- In a separate project, the EPA’s Trade and Environmental Assessment Model (TEAM) has been interfaced with the standard GTAP model. TEAM converts aggregate economic results from the GTAP model into changes in the U.S. for approximately 1,200 sectors, and reports environmental outcomes for nine pollutant categories covering 1,100 chemicals in water, air, agriculture, and hazardous waste. Model simulations have looked at issues such as the worldwide removal of domestic subsidies and global trade liberalization.

Climate Economics Branch, Climate Change Division, Office of Atmospheric Programs

- The Climate Economics Branch in EPA's Climate Change Division has a 5-year cooperative agreement with the GTAP project that has just entered its second year. The project is entitled “Dynamic Global Economic Modeling of Greenhouse Gas Emissions and Mitigation from Land-Use Activities.” The project’s goal is to advance dynamic global economic modeling of greenhouse gas emissions and mitigation from land-use, land-use change, and forestry activities (LULUCF). Specifically, the project addresses the needs of the international modeling community for more accurate and comprehensive land-use activity data and modeling elements by: (1) refining and extending GTAP’s current basic land-use database, (2) developing land-use modeling within a dynamic global general equilibrium economic framework to appropriately evaluate land-use mitigation alternatives relative to energy-related mitigation alternatives over time, and (3) developing dynamic general equilibrium modeling of LULUCF in stages that provide the modeling community with useful intermediate tools on which to build. The principal investigator for the project is Dr. Thomas Hertel, Executive Director, Center for Global Trade Analysis at Purdue University. The project draws on a collaboration with EPA's principal researcher, Dr. Steven Rose, and co-PIs Dr. Brent Sohngen, Ohio State University, and Dr. Navin Ramankutty, McGill University.
