# Acknowledgment

- This study is supported by JSPS KAKENHI Grant No. JP22K01464
- I appreciate valuable comments from Shimpei Aii, Hiroshi Hamasaki, and Masashi Oya

1. Introduction
2. GTAP-E Data Extension for Hydrogen
3. GDyn-E Model Extension and Scenarios
4. Results

# Introduction

---

# Background

- Hydrogen emits no CO<sub>2</sub> when used as an energy source
- Hydrogen can be a better option for some industries where electrification is hard to adopt;  
e.g. aviation and maritime transport, iron and steel, chemicals
- Japanese government have set a target of carbon neutrality by 2050 and designed the Basic Hydrogen Strategy
- On February 2024, the government approved a new legislation to provide subsidies to suppliers of hydrogen and ammonia

# Aim of this study

- to explore potential impact of subsidies on hydrogen supply (production, imports) in Japan,
- by incorporating hydrogen as a new energy subproduct into the GTAP-E database and the GDyn-E model.
- Policy scenario experiments hydrogen supply subsidy in Japan for 2030-2044

# GTAP-E Data Extension for Hydrogen

---

# Data Extension

- **GTAP-E database**
  - GTAP database v.10a (Aguiar et al., 2019), 2014 benchmark
  - 30 counties/regions and 16 industries
- **Hydrogen Production**
  - World hydrogen production (Brown, 2016), used as control total
  - Distribute the total to countries
- **Hydrogen Trade**
  - U.N. COMTRADE provides the information on hydrogen trade
  - Period coverage 2000–2022
- **Divide chemical industry in GTAP-E database**
  - Apply MSplitCom (Horridge, 2008)
  - Chemical -> Hydrogen + (other) Chemical
  - For use structure from the 2015 input-output table of Japan, basic sector classification of compressed gas and liquefied gas

## World Hydrogen Production by Source, 2014

| Source           | Industry      | Quantity<br>(million metric tons) |
|------------------|---------------|-----------------------------------|
| <b>Captive</b>   |               | <b>55.39</b>                      |
|                  | Ammonia       | 31.81                             |
|                  | Oil Refining  | 10.08                             |
|                  | Methanol      | 13.5                              |
| <b>Byproduct</b> |               | <b>40.93</b>                      |
|                  | Coke/Iron     | 15.63                             |
|                  | Oil Refining  | 17.08                             |
|                  | Ethylene      | 6.38                              |
|                  | Chloro-Alkali | 1.84                              |
| <b>Merchant</b>  | -             | <b>6.16</b>                       |
| <b>Total</b>     | -             | <b>102.48</b>                     |

# Distribution Rates

We collect indicators for **industry** × **country** to compute the distribution rate by source from following institutions;  
Hydrogen Analysis Resource Center; U.S. National Minerals Information Center; U.N. Industrial Commodity Production Statistics

| Source             | Industry      | Indicator                    |
|--------------------|---------------|------------------------------|
| Captive, Byproduct | Ammonia       | Ammonia production           |
|                    | Oil Refining  | Hydrogen production capacity |
|                    | Methanol      | Methanol production          |
|                    | Coke/Iron     | Coke-oven gas                |
|                    | Ethylene      | Ethylene production capacity |
|                    | Chloro-Alkali | Caustic soda                 |
| Merchant           | -             | Hydrogen production capacity |

# Hydrogen Production in 2014 (US\$, billion)

Note: World hydrogen production accounts for 0.07% in world total production.

Source: Author

# World Hydrogen Trade, 2000–2022 (US\$, million)

Note: Hydrogen trade accounts for 0.001% in total goods trade in the world.

Top 3 exporters: Belgium, Netherlands, Canada

# GDyn-E Model Extension and Scenarios

---

# Model Structure of Production and Consumption

GTAP-E and GDyn-E model (Burniaux and Truong, 2002; McDougall and Golub, 2007; Corong et al., 2017; Golub, 2013)

$$O_{js} = \begin{cases} D_{js} & (\text{dom. supply}) \\ Q_{jrs} & (\text{exports}) \end{cases}$$

Production:

- $O_{js}$  output of industry  $j$  in country  $s$
- $VA_{js}$  value-added composite used by  $j$  in  $s$
- $X_{ijs}$  composite good  $i$  used by  $j$  in  $s$

Consumption:

- $U_s$  per capita utility from aggregate household expenditure in  $s$
- $U_s^P, U_s^S, U_s^G$  sub-utility from private consumption, savings, gov't expenditure
- $X_{is}^P$  composite good  $i$  for consumption
- $X_{is}^G$  composite good  $i$  for gov't expenditure

# Hydrogen as an Energy Subproduct in GTAP-E / GDyn-E

industry  $j$  in country  $s$

# Baseline / Experimental Scenario

Baseline is a hypothetical future state of the global economy for 2014–2050, constructed with the following data inputs:

- World Population Prospects, (U.N., 2022)  
Total and working age population
- Long-Term Baseline Projections (OECD, 2023)  
Real GDP
- Global Carbon Budget 2023 (Global Carbon Project, 2023)  
CO<sub>2</sub> emission for 2014–2022

## Experimental Scenario

- Japan provides subsidies on hydrogen supply (production and import) for 2030–2044
- For simplicity, no tax (cap & trade) on CO<sub>2</sub> emissions, no tech change in this experiment

## Results

---

# Impact on Hydrogen Production and Import in Japan

(a) Hydrogen Production Volume (bi.US\$)

(b) Hydrogen Import Volume (mi.US\$)

Note: Subsidies on hydrogen production and import for 2030-2044.

# Impact on real GDP (%)

Change in real GDP relative to the baseline (%)  
for Japan and three countries mostly affected in terms of %

# Summary

This study attempts to

- to explore potential impact of subsidies on hydrogen supply (production, imports) in Japan for 2030-2044,
- by incorporating hydrogen as a new energy subproduct into the GTAP-E database and the GDyn-E model.

Results show that

- hydrogen supply rises over baseline, and the positive impact remains after 2045
- real GDP in Japan increases while others slightly decrease
- CO2 emissions in Japan become larger as compared baseline

# Way forward

- Technological change in hydrogen production:  
reflect the rapid development in hydrogen industry,  
introduce sub-nest under hydrogen for “green,” “blue,” etc.
- Tax on CO<sub>2</sub> emissions, cap and trade
- Target the recent data on hydrogen production and trade in  
baseline
- Improve the hydrogen data construction process
