

D Representative Table and Composite Regions

Erwin Corong

This chapter describes three sets of regional groupings that are used in the construction of the GTAP Data Base, namely: the representative region, geographic regions, and composite regions. Input-Output (I-O) tables are constructed for the representative region and for composite regions. A classification of the global economy into a few large geographic regions is used to construct IOTs for composite regions and in filling in missing macroeconomic data (see chapter 7).

D.1 Representative Table

The representative table is an I-O table created as a linear combination of the set of IOTs which have full sectoral disaggregation. Ideally, the regions comprising the representative table should represent the broad spectrum of economic development and geographic location of the regions in the data base. Table 9.8 provides the list of 48 countries whose IOTs form the representative I-O table used in GTAP 12.

Table 9.8: Countries Included in the Representative I-O Table

ISO3	Country	ISO3	Country	ISO3	Country
aus	Australia	hrv	Croatia	nld	Netherlands
nzl	New Zealand	cyp	Cyprus	pol	Poland
jpn	Japan	cze	Czech Republic	prt	Portugal
kor	Korea	dnk	Denmark	rou	Romania
twn	Taiwan	est	Estonia	svk	Slovakia
khm	Cambodia	fin	Finland	svn	Slovenia
sgp	Singapore	fra	France	esp	Spain
bgd	Bangladesh	deu	Germany	swe	Sweden
usa	United States of America	grc	Greece	gbr	United Kingdom
mex	Mexico	hun	Hungary	mdg	Madagascar
bra	Brazil	irl	Ireland	mwi	Malawi

ury	Uruguay	lva	Latvia	tza	Tanzania
aut	Austria	ltu	Lithuania	zmb	Zambia
bel	Belgium	lux	Luxembourg	bwa	Botswana
bgr	Bulgaria	mlt	Malta	zaf	South Africa

The representative I-O table is used in several stages in the data base construction process. In the initial stage of checking contributed I-O tables, cost and sales shares calculated from an I-O table submitted to GTAP are compared to those from the representative table—to identify highly unusual shares and possible errors in the contributed I-O table. Once an I-O table is found to be

acceptable and is included in the GTAP data construction process, the I-O table undergoes an initial cleaning procedure where the representative table is used as the source of scaling factors to revise abnormal or infeasible values in the initial I-O table.

The representative table is also used in the I-O table disaggregation procedure (chapter 9B). For sectors that are not disaggregated in the original I-O table, the structure of production, intermediate usage, and consumption are adapted from the representative table. Note that this only applies to disaggregation of non-agricultural sectors, since we use agricultural I-O data to disaggregate agricultural sectors (see chapter 9B.2).

D.2 Geographic Regions

During the GTAP data construction process, we use a set of 19 geographic regions given in table 9.9 to create a macroeconomic dataset. Dividing the global economy into a fewer number of geographic regions is useful in certain aspects of the data base construction. In generating a complete macroeconomic dataset for each geographic region, averages of the shares of GDP aggregates to total GDP for countries with available data are used to fill in estimates of the GDP aggregates for countries with missing data (see chapter 7). Table 9.10 provides a mapping between the 19 geographic groups and the 251 standard countries. As discussed in the next section, geographic regions are also used in the construction of IOTs for composite regions.

Table 9.9: Geographic Regions used in GTAP Data Construction

Region code	Description	Region code	Description
OCEN	Oceania	NEUR	Northern Europe
EAAS	Eastern Asia	WEUR	Western Europe
SEAS	South-eastern Asia	EEUR	Eastern Europe
STAS	Southern Asia	SEUR	Southern Europe
CEAS	Central Asia	NAFR	Northern Africa
WEAS	Western Asia	WAFR	Western Africa
NAMR	North America	CAFR	Central Africa
CARB	Caribbean	EAFR	Eastern Africa
CAMR	Central America	SAFR	Southern Africa
SAMR	South America		

Because of the constraint imposed by the unavailability of a single I-O table for any of the countries included in a geographic region such as the Caribbean, a smaller set of 15 geographic regions is used in constructing the composite regions. This was done by classifying the Caribbean, Central America, and South America together as the larger Latin America region and defining the larger Sub-Saharan Africa region as composed of Eastern Africa, Central Africa, Western Africa, and Southern Africa.

D.3 Composite Regions

The GTAP 12 Data Base includes 145 contributed IOTs out of 163 regions. The I-O data for these countries are used to construct IOTs for the 18 composite regions which account for the rest of the economies in a particular geographical area—i.e., including the Rest of the World (XTW) region which represents remote territories such as Antarctica, Bouvet Islands, British Indian Ocean Territory and French Southern Territories.

It should be noted that although we continue to use the same names as some composite regions in previous versions of the GTAP Data Base, the composition of some of these regions have changed due to new IOTs we received, thereby lowering the number of countries remaining in composite regions. Further we assume here that the average patterns of production, consumption, and savings in any individual country in the 18 composite regions can be approximated by patterns observed in one of its neighboring primary regions.

In constructing an I-O table for a composite region, we start by associating a primary region to each of the member countries in a composite region. The steps involved in the procedure are:

- all the 251 standard countries are matched on the basis of similarity in GDP per capita with a primary region within the same geographic region
- the target total GDP is generated for each composite region; this is the sum of GDP for the individual countries comprising the composite region
- the primary regions matching the countries in the composite region in terms of similarity in GDP per capita are noted and GDP weights (ratio of country GDP to total target GDP) are assigned to each primary region
- the I-O table for each composite region is constructed by combining the I-O data from the primary region tables summed according to the GDP share weights.

The IOTs for the composite regions are then updated and adjusted to match aggregated regional data on macroeconomic aggregates, trade, protection, and energy in the FIT procedure documented in chapter 15.A.
